Evidence Based Approach

THE PRACTICE OF EMERGENCY MEDICINE/CONCEPTS

Optimizing Emergency Department Front-End Operations

Jennifer L. Wiler, MD, MBA
Christopher Gentle, MD
James M. Halfpenny, DO
Alan Heins, MD
Abhi Mehrotra, MD
Michael G. Mikhail, MD
Diana Fite, MD

From the Division of Emergency Medicine, Washington University in St. Louis School of Medicine, St Louis, MO (Wiler); the Department of Emergency Medicine, Christiana Care Health Services, Newark, DE (Gentle); Forrest Hills Hospital, Forrest Hills, NY (Halfpenny); the Department of Emergency Medicine, University of South Alabama College of Medicine and Medical Center, Mobile, AL (Heins); the Department of Emergency Medicine, University of North Carolina, Chapel Hill, NC (Mehrotra); the Department of Emergency Medicine, St. Joseph Mercy Hospital, Ann Arbor, MI (Mikhail); and the Department of Emergency Medicine, University of Texas Medical School at Houston, Houston, TX (Fite).

As administrators evaluate potential approaches to improve cost, quality, and throughput efficiencies in the emergency department (ED), “front-end” operations become an important area of focus. Interventions such as immediate bedding, bedside registration, advanced triage (triage-based care) protocols, physician/practitioner at triage, dedicated “fast track” service line, tracking systems and whiteboards, wireless communication devices, kiosk self check-in, and personal health record technology (“smart cards”) have been offered as potential solutions to streamline the front-end processing of ED patients, which becomes crucial during periods of full capacity, crowding, and surges. Although each of these operational improvement strategies has been described in the lay literature, various reports exist in the academic literature about their effect on front-end operations. In this report, we present a review of the current body of academic literature, with the goal of identifying select high-impact front-end operational improvement solutions. [Ann Emerg Med. 2010;55:142-160.]

INTRODUCTION

Emergency Department Crowding and the Need for Operational Improvement Strategies

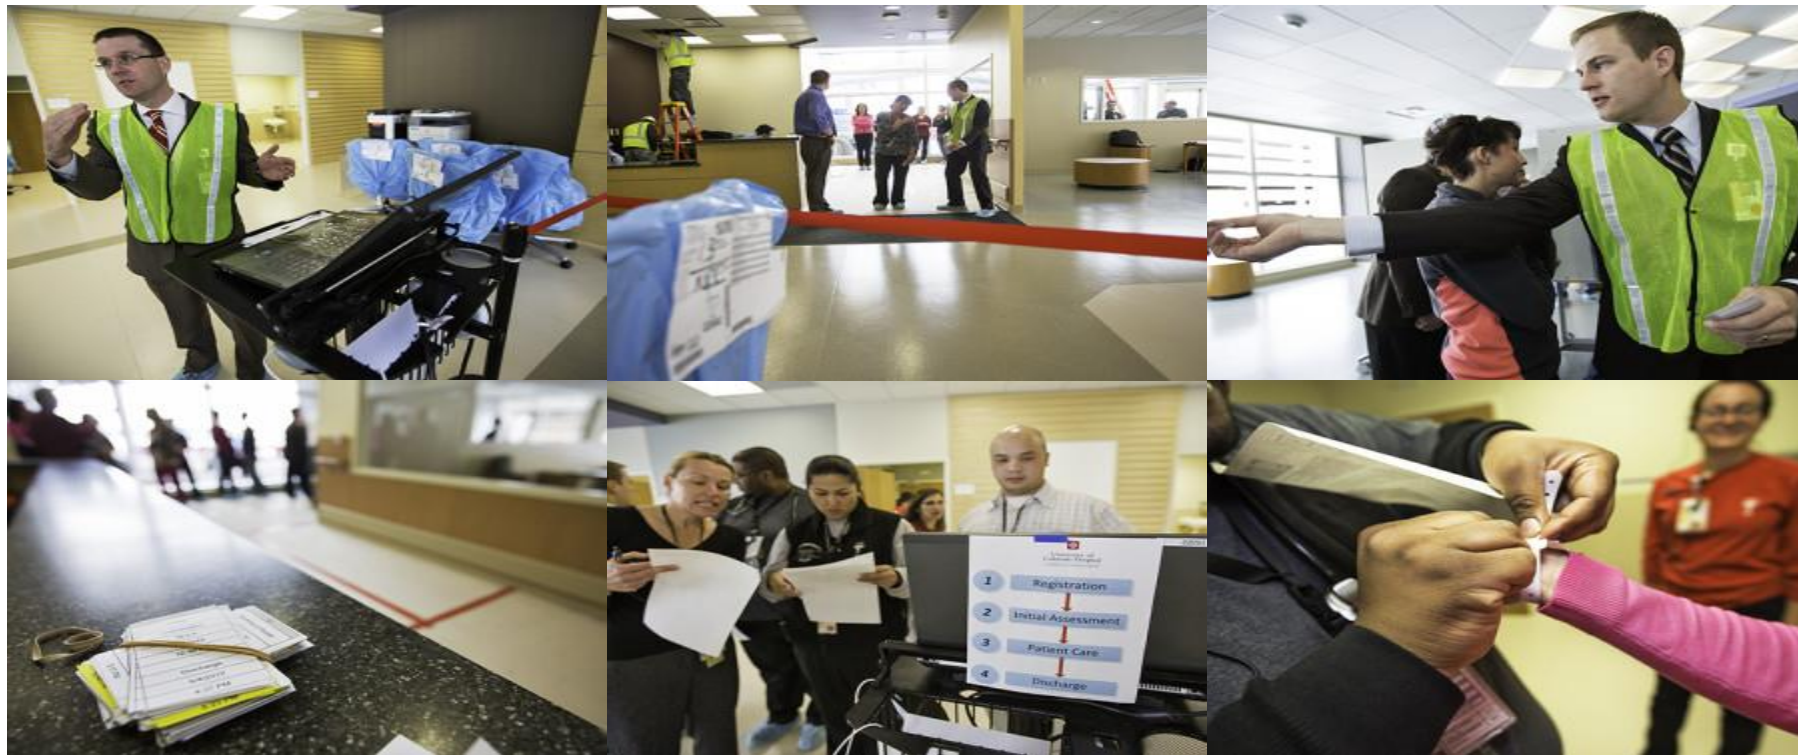

For nearly 2 decades, emergency department (ED) crowding has been recognized as a growing problem. From 1995 through

has emphasized the need for smoothing ED patient flow and, in January 2005, implemented a new leadership standard, managing patient flow, which mandates that hospitals “. . . develop and implement plans to identify and mitigate impediments to efficient patient flow throughout the

Abstract

Health care systems have utilized various process redesign methodologies to improve care delivery. This article describes the creation of a novel process improvement methodology, Rapid Process Optimization (RPO). This system was used to redesign emergency care delivery within a large academic health care system, which resulted in a decrease: (1) door-to-physician time (Department A: 54 minutes pre vs 12 minutes 1 year post; Department B: 20 minutes pre vs 8 minutes 3 months post), (2) overall length of stay (Department A: 228 vs 184; Department B: 202 vs 192), (3) discharge length of stay (Department A: 216 vs 140; Department B: 179 vs 169), and (4) left without being seen rates (Department A: 5.5% vs 0.0%; Department B: 4.1% vs 0.5%) despite a 47% increased census at Department A (34 391 vs 50 691) and a 4% increase at Department B (8404 vs 8753). The novel RPO process improvement methodology

Solve problems

- Would we want to be a customer
 - ▣ If we do, you likely will
- Is there a revenue opportunity
- Is there an equity opportunity
- Does the partner have a team
- Have they had success
- Are they well funded

Three problems (maybe yours?)

- Nobody follows guidelines and Clinical Decision Support is too hard
 - ▣ Hard stops
 - ▣ Too many clicks
 - ▣ Nobody follows paper guidelines or leaves their work-flow
- Over prescribing
 - ▣ Opioids are killing people
 - ▣ Can't remember every medicine
- Knowledge dissemination
 - ▣ Emailing a presentation and quiz is not dissemination

Can an EMR help providers make informed decisions?

- ❑ 85%
- ❑ 5-75%
- ❑ 1/5
- ❑ Alert/warning fatigue
- ❑ 24/7/365 50%
- ❑ Clicked into submission

- **Has been used for more than 2,000 prescription decisions since launch**
- **Prescribers are selecting an RxCheck recommendation 55% of the time**
- **Selection of RxCheck recommendations has grown 28% since launch**
- **UCHealth has identified 10 minutes of time savings, per prescriber during each shift**

Outcomes Data

	UTI (n=548)		Pneumonia (n=307)		Tonsillitis (n=348)	
<i>Guidelines</i>	<i>Pre</i>	<i>Post</i>	<i>Pre</i>	<i>Post</i>	<i>Pre</i>	<i>Post</i>
Recommended (First line)	33.1%	85.5%	12.0%	87.5%	26.1%	20.0%
Recommended Alternative	52.1%	0.0%	76.1%	0.0%	39.3%	53.3%
Not Recommended	14.8%	16.1%	12.0%	12.5%	34.7%	24.4%

Next

- ❑ Expand to all 30 ED's
- ❑ Include >75% of all medications
- ❑ Pilot with primary care
- ❑ Pilot with Heart Failure
- ❑ Partnership with Novartis
- ❑ Partnership with Anthem

Opioids

- ❑ Epidemic
- ❑ Regulation
- ❑ Prescription Drug Monitoring Program (PDMP) is next to useless

Appriss/PDMP platform

Results

- Significant decrease in New prescriptions
- Significant decrease in pills prescribed
- Significant decrease in provider variability
- PDMP utilization increased from 9% to 75%

Knowledge Dissemination

- If it's important, how do we teach 400 staff?
- Is an emailed powerpoint and quiz the best we can do?
 - ▣ HealthStream

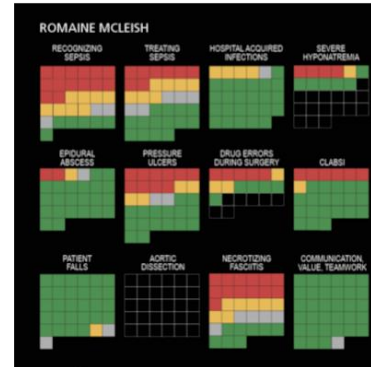

- Founded in 2000 and is based in Boulder, Colorado - formerly known as Vivis Inc.
- Neuroscience-based education develops a learning software that improves knowledge transfer and enables long-term learning
- Accelerated memory protocol systematically translates information from a textbook, training document, or study material into a learner's long-term memory.
- Uses memory and learning characteristics to focus on acquiring, retaining, and recalling.
- Professional test prep, industry (food, manufacturing)
